Unnecessary pain

The immune system is essential for protecting our bodies from infection and disease. However, in people with allergies, the immune system uselessly reacts to harmless compounds. Fortunately, there are several natural herbs that are able to block this inappropriate immune response and alleviate the misery of allergic symptoms.

Herbs against allergy

Perilla is a plant that reduces allergic symptoms such as sneezing, nasal obstruction, and itchy eyes and skin, and also reduces the severity of asthma. Rosmarinic acids help deal with asthma and hay fever. Quercetin inhibits bronchial obstruction in asthma. Butterbur alleviates symptoms of seasonal allergies, and improves lung ventilation in patients with asthma or bronchitis. Other anti-allergic compounds include luteolin, and mangiferin.

Allergy protection at all levels

The ingredients in AllerControl work in a number of ways. Quercetin, perilla, mangiferin and luteolin block the release of histamine and other mediators of the allergic response. Many symptoms of allergies are due to inflammation and the compounds in AllerControl work to block the inflammatory process. Together, these compounds soothe and relieve the causes and symptoms of allergy.
Allergies- pain without gain

Allergies are a common problem that affects 20% of Americans, and the prevalence of allergy has lately been on the rise. Allergies are caused by a glitch in the immune system. Instead of only responding to pathogens or cancer cells, some people have hereditary predispositions to react to harmless compounds (allergens) such as food proteins, animal hair proteins, plant pollens, drugs, or substances like latex. AllerControl contains several natural compounds that work together to relieve the misery of allergies.

Perilla

Perilla frutescens is a plant whose functional components (flavonoid aglycones such as luteolin, apigenin, and rosmarinic acid) have been studied for their anti-allergic and anti-inflammatory potential. Perilla seed oil has been shown to improve breathing measurements in asthmatics, and perilla seed extract improves allergic symptoms such as sneezing, nasal obstruction, and itchy skin and eyes.

Luteolin

Luteolin is a main component of Perilla frutescens which has antimutagenic, antioxidant, anti-inflammatory and anti-allergic effects.

Rosmarinic acid

Rosmarinic acid is an extract that is found in plants such as rosemary and perilla. Clinical studies have shown that it helps to relieve the symptoms of seasonal allergies. Besides its effects on allergies, it has therapeutic potential in dealing with or preventing spasmogenic disorders, peptic ulcers, inflammatory diseases, liver toxicity, atherosclerosis, ischemic heart disease, and even cancer.

Quercetin

Quercetin is the most widely consumed flavonoid in the diet and has been used to treat a variety of complaints. Cellular and animal studies have found it to be a potent inhibitor of allergic and inflammatory responses. It is also a powerful antioxidant, and has benefits in heart health and diabetic complications.

Mangiferin

Mangiferin is an extract of the plant Mangifera indica L. This plant is used in Cuba to help with various disorders including bronchial asthma, atopic dermatitis, and other allergic diseases. It has been reported to have antispasmodic, antimicrobial and fever-reducing effects. Mangiferin is the dominant component of this plant, and has strong anti-allergic effects. It also has antiviral, anti-tumour and antioxidant activity.

Butterbur

Butterbur (petasites hybridus) is a shrub whose extracts help improve the conditions of asthma and reduce symptoms of seasonal allergies, likely due to their effectiveness at reducing nasal responsiveness. Butterbur also has benefits in migraines and has been shown to decrease migraine frequency by 60%, with a decrease in the duration and intensity of migraine symptoms.

How it works

Allergies can be combated by blocking the allergic response or by targeting inappropriate inflammation, which lies at the root of allergic symptoms. The ingredients in AllerControl reduce levels of IgE, the antibody that recognizes an allergen and initiates an allergic response. They also prevent the release of histamine and other allergic mediators, block the production of pro-inflammatory signaling molecules, and decrease the production and activation of immune cells that contribute to allergic and inflammatory pathways. Through these effects, AllerControl provides a natural solution for allergies.
